Abstract

This descriptive study determined the level of awareness on the effects of premarital sex among marine engineering students at John B. Lacson Colleges Foundation-Molo, Inc.

This study utilized the 100 marine engineering students who have enrolled during second semester 2002- 2003. It used

the purposively sampling method. The researcher made rating scale on the level of awareness on the effects of

premarital sex was used to gather data. Descriptive

statistics used were means and standard deviations. Results

revealed that students' level of awareness on the effects

of premarital sex was found "aware". The students level of

awareness on the effects of premarital sex when classified

according to their year level, high school origin, type of

residence, and gender was found to be "aware".
